#### On the numerical index of vector-valued function spaces

Elmouloudi ED-DARI, Mohamed Amine KHAMSI, and Asuman Güven AKSOY

**Abstract.** Let X be a Banach space and  $\mu$  a positive measure. We show that  $n(L_p(\mu, X)) = \lim_m n(l_p^m(X)), 1 \le p < \infty$ . Also we investigate the positivity of the numerical index of  $l_p$ -spaces.

## 1 Introduction.

Let X be a Banach space over  $\mathbb{R}$  or  $\mathbb{C}$ , we write  $B_X$  for the closed unit ball and  $S_X$  for the unit sphere of X. The dual space is denoted by  $X^*$  and the Banach algebra of all continuous linear operators on X is denoted by B(X). The numerical range of  $T \in B(X)$  is defined by

$$V(T) = \{x^*(Tx): x \in S_X, x^* \in S_{X^*}, x^*(x) = 1\}.$$

The  $numerical\ radius$  of T is then given by

$$v(T) = \sup\{|\lambda| : \lambda \in V(T)\}$$

Clearly, v is a semi norm on B(X) and  $v(T) \leq ||T||$  for all  $T \in B(X)$ . The numerical index of X is defined by

$$n(X) = \inf\{v(T): T \in S_{B(X)}\}.$$

The concept of numerical index was first suggested by Lumer [7] in 1968. Since then a lot of attention has been paid to this constant of equivalence between the numerical radius and the usual norm in the Banach algebra of all bounded linear operators of a Banach space. Classical references here are [1], [2]. For recent results we refer the reader to [3], [5], [6], [8], [10].

In this paper we show that for any positive measure  $\mu$  and Banach space X, the numerical index of  $L_p(\mu, X)$ ,  $1 \leq p < \infty$  is the limit of the sequence of numerical index of  $l_p^m(X)$ . This gives a partial answer to Martín's question [9] and generalizes the result obtained for the scalar case [5]. Also we study the positivity of the numerical index of  $l_p$ -space.

Key words: Numerical index - Numerical radius.

<sup>&</sup>lt;sup>0</sup>Mathematics Subject Classification (2000): 47A12.

Here  $L_p(\mu, X)$  is the classical Banach space of p-integrable functions f from  $\Omega$  into X where  $(\Omega, \Sigma, \mu)$  is a given measure space. And  $l_p(X)$  is the Banach space of sequences  $x = (x_n)_{n \ge 1}, x_n \in X$ , such that  $\sum_{n=0}^{\infty} ||x_n||^p < \infty$ . And finally  $l_p^m(X)$  is the Banach space of

finite sequences  $x = (x_n)_{1 \le n \le m}$ ,  $x_n \in X$ , equipped with the norm  $||x||_p = \left(\sum_{n=1}^m ||x_n||^p\right)^{\frac{1}{p}}$ .

### 2 Main results.

**Theorem 2.1.** Let X be a Banach space. Then, for every real number  $p, 1 \le p < \infty$ , the numerical index of the Banach space  $l_p(X)$  is given by

$$n(l_p(X)) = \lim_{m} n(l_p^m(X)).$$

Proof. Let  $m\geq 1$  and  $T:l_p^m(X)\to l_p^m(X)$   $x\mapsto (T_1(x),...,T_m(x))$ . Define the linear operator  $\tilde{T}:l_p(X)\to l_p(X)$  as follows for  $x=(x_1,...,x_m,x_{m+1},...)\in l_p(X),$   $\tilde{T}(x)=(T_1(x_1,...,x_m),...,T_m(x_1,...,x_m),0,...)$ . Clearly,  $\tilde{T}$  is bounded and  $\|T\|=\|\tilde{T}\|$ . We have also  $v(T)=v(\tilde{T})$ . To prove this, let us first note that if  $x=(x_1,...,x_m,...)\in S_{l_p(X)}$ , then there exists an element, namely  $x_x^*$ , in  $S_{l_q(X^*)}$ , where q is the conjugate exponent to p, such that  $x_x^*(x)=1$ . Explicitly  $x_x^*=(\|x_1\|^{p-1}x_1^*,...,\|x_m\|^{p-1}x_m^*,...)$  where the  $x_k^*$ 's are taken in  $S_{X^*}$  such that  $x_k^*(x_k)=\|x_k\|$ . Now, let  $\varepsilon>0$ . Following the expression  $v(\tilde{T})=\sup\{|x_x^*(\tilde{T}x)|:x\in S_{l_p(X)}\}$  ([4], Lemma 3.2 and Proposition 1.1) there exists  $x=(x_1,...,x_m,x_{m+1},...)\in S_{l_p(X)}$  such that

$$v(\tilde{T}) - \varepsilon < |x_x^*(\tilde{T}x)|$$

$$= |(||x_1||^{p-1}x_1^*, ..., ||x_m||^{p-1}x_m^*)(T(x_1, ..., x_m))|.$$

Put  $r := \left(\sum_{k=1}^m \|x_k\|^p\right)^{1/p} \le 1$ . Then we obtain  $v(\tilde{T}) - \varepsilon < r^p v(T)$  which yields  $v(\tilde{T}) \le v(T)$ . The reverse inequality is easy. Therefore

$$\{v(T): T \in l_n^m(X), ||T|| = 1\} \subset \{v(U): U \in l_n(X), ||U|| = 1\}$$

which yields  $n(l_p(X)) \leq n(l_p^m(X))$ . Consequently  $n(l_p(X)) \leq \liminf_m n(l_p^m(X))$ . Now we shall prove that  $\limsup_m n(l_p^m(X)) \leq n(l_p(X))$ . Let  $T \in B(l_p(X))$ . Define the sequence of operators  $\{S_m\}_m$  as follows; for each  $m \geq 1$ ,  $S_m$  is defined on  $l_p^m(X)$  by

$$S_m(x) = (T_1(x_1, ..., x_m, 0, 0, ...), ..., T_m(x_1, ..., x_m, 0, 0, ...)) \qquad (x \in l_p^m(X))$$

Clearly, the  $S_m$ 's are bounded and  $||S_m|| \leq ||T||$  for all m. We claim that

(i) 
$$||S_m|| \rightarrow ||T||$$

(ii) 
$$v(S_m) \to v(T)$$
.

Indeed, we consider the sequence of operators  $\{\tilde{S}_m\}_m$  defined on  $l_p(X)$  by

$$\tilde{S}_m(x) = (T_1(x_1, ..., x_m, 0, 0, ...), ..., T_m(x_1, ..., x_m, 0, 0, ...), 0, 0, ...)$$

for all  $x=(x_1,...,x_m,x_{m+1},...)\in l_p(X)$ . It is easy to see that  $\|S_m\|=\|\tilde{S}_m\|$ , and  $\tilde{S}_m$  converges strongly to T. This implies that  $\|T\|\leq \liminf_m \|\tilde{S}_m\|$ , and it follows that  $\|S_m\|\to \|T\|$ . As in (i) we have also  $v(S_m)=v(\tilde{S}_m)$ , so it is enough to prove that  $v(\tilde{S}_m)\to v(T)$ . Let  $\varepsilon>0$  and fix  $u\in S_X$ ,  $u^*\in S_{X^*}$  such that  $u^*(u)=1$ . There exists  $x\in S_{l_p(X)}$  such that

$$|x_r^*(Tx)| > v(T) - \varepsilon (1)$$

For each  $n \geq 1$ , consider

$$x^{n} = (x_{1}, ..., x_{n-1}, \lambda_{n}u, 0, 0, ...); \ x_{x^{n}}^{*} = (\|x_{1}\|^{p-1}x_{x_{1}}^{*}, ..., \|x_{n-1}\|^{p-1}x_{x_{n-1}}^{*}, \lambda_{n}^{p-1}u^{*}, 0, 0, ...)$$

where 
$$\lambda_n = \left(\sum_{k=n}^{\infty} ||x_k||^p\right)^{1/p}$$
. Then

$$x_{r^n}^*(x^n) = 1 = ||x_{r^n}^*|| = ||x^n||$$

Moreover,  $||x-x^n|| \to 0$  and  $||x_x^*-x_{x^n}^*|| \to 0$  where  $x_x^* = (||x_1||^{p-1}x_{x_1}^*, ..., ||x_n||^{p-1}x_{x_n}^*, ...)$ . It follows that  $x_{x^n}^*(Tx^n) \to x_x^*(Tx)$  as n tends to infinity. Let  $n_0 \ge 1$  be such that

$$|x_{x^n}^*(Tx^n)| > v(T) - \varepsilon \quad (n \ge n_0). \tag{2}$$

Since  $\tilde{S}_m$  converges strongly to T, thus for fixed  $n \geq n_0$ ,  $x_{x^n}^*(\tilde{S}_m x^n)$  converges to  $x_{x^n}^*(Tx^n)$  as m tends to infinity. So there is  $m_0 \geq n$  such that

$$|x_{x^n}^*(\tilde{S}_m x^n)| > v(T) - \varepsilon \quad (m > m_0). \tag{3}$$

This yields  $v(\tilde{S}_m) > v(T) - \varepsilon$  for all  $m \ge m_0$  and therefore  $v(\tilde{S}_m)$  converges to v(T) as m tends to infinity. Now, following (i) and (ii) we have  $n(l_p(X)) \ge \limsup_{m} n(l_p^m(X))$ . Indeed,

for a given  $\varepsilon > 0$ , we find  $T \in S_{B(l_p(X))}$  such that

$$n(l_p(X)) + \varepsilon > v(T)$$

Since  $v(T) = \lim_{m} v(\tilde{S}_m)$ , there exists  $m_0$  such that

$$n(l_p(X)) + \varepsilon > v(\tilde{S}_m) \quad (m \ge m_0)$$

But  $v(\tilde{S}_m) = v(S_m) \ge n(l_p^m(X)) \|S_m\|$ , and  $\|S_m\| \to \|T\| = 1$ , so there exists  $k_0 \ge m_0$  such that

$$n(l_p(X)) + \varepsilon > n(l_p^m(X))(1-\varepsilon) \quad (m \ge k_0)$$

This implies  $n(l_p(X)) \ge \limsup_{m} n(l_p^m(X))$  and completes the proof of Theorem 2.1.

It is well known that  $n(\bigoplus_{\lambda} X_{\lambda})_{l_{\infty}} = \inf_{\lambda \in \Lambda} n(X_{\lambda})$  [9]. This shows that, in particular,  $n(l_{\infty}(X)) = n(X)$  (=  $\lim_{m} n(l_{\infty}^{m}(X))$ ). So, Theorem 2.1 is also valid for  $p = \infty$ .

**Theorem 2.2.** Let  $(\Omega, \Sigma, \mu)$  be a  $\sigma$ -finite measure space. Then, for every Banach space X and every real number  $p, 1 \leq p < \infty$ ,

$$n(L_p(\mu, X)) = n(l_p(X)).$$

Proof. Let us first prove that  $n(L_p(\mu, X)) \leq n(l_p(X))$ . For this we adapt the proof due to Javier and Martin for the scalar case (not published result). Indeed, if  $\mu$  is not atomic,  $L_p(\mu, X)$  is isometric to  $L_p(\mu, X) \oplus_p L_p(\mu, X)$ , so they have the same numerical index. Let  $T = (T_1, T_2) \in B(l_p^2(X))$  and define the operator S on  $L_p(\mu, X) \oplus_p L_p(\mu, X)$  by  $S(f_1, f_2)(\omega) = T(f_1(\omega), f_2(\omega))$ . One can check easily that ||T|| = ||S||. Moreover,

$$v(T) = v(S)$$
. Indeed, let  $f_1 = \sum_{i=1}^{m} x_i \frac{1_{A_i}}{\mu(A_i)^{1/p}}$ ,  $f_2 = \sum_{i=1}^{n} y_i \frac{1_{B_i}}{\mu(B_i)^{1/p}}$  be simple functions in

 $L_p(\mu, X)$  with  $||(f_1, f_2)||^p = \sum_{i=1}^m ||x_i||^p + \sum_{i=1}^n ||y_i||^p = 1$ . For each i we can find  $x_i^*$  and  $y_i^*$ 

in 
$$S_{X^*}$$
 such that  $x_i^*(x_i) = ||x_i||$  and  $y_i^*(y_i) = ||y_i||$ . If we set  $g_1 = \sum_{i=1}^m ||x_i||^{p-1} x_i^* \frac{1_{A_i}}{\mu(A_i)^{1/q}}$ 

and  $g_2 = \sum_{i=1}^n \|y_i\|^{p-1} y_i^* \frac{1_{B_i}}{\mu(B_i)^{1/q}}$ , we have clearly  $(g_1, g_2) \in S_{L_q(\mu, X^*) \oplus_q L_q(\mu, X^*)}$  and  $(g_1, g_2), (f_1, f_2) >= 1$ . Moreover,

$$|(g_1, g_2)(S(f_1, f_2))| \leq \int_{\Omega} |(g_1(\omega), g_2(\omega))(T(f_1(\omega), f_2(\omega)))| d\mu(\omega)$$
  
$$\leq v(T) \int_{\Omega} ||f_1(\omega)||^p + ||f_2(\omega)||^p d\mu(\omega) = v(T).$$

Following [4], we have  $v(S) \leq v(T)$ . For the reverse inequality, let  $(x_1, x_2) \in S_{l_p^2(X)}$ . Take  $A \in \Sigma$  with  $\mu(A) > 0$  and consider  $(f_1, f_2) = \left(x_1 \frac{1_A}{\mu(A)^{\frac{1}{p}}}, x_2 \frac{1_A}{\mu(A)^{\frac{1}{p}}}\right)$ . From what we have just seen  $(g_1, g_2) = \left(\|x_1\|^{p-1} x_1^* \frac{1_A}{\mu(A)^{\frac{1}{q}}}, \|x_2\|^{p-1} x_2^* \frac{1_A}{\mu(A)^{\frac{1}{q}}}\right) \in S_{L_q(\mu, X^*) \oplus_q L_q(\mu, X^*)}$  and  $(g_1, g_2), (f_1, f_2) >= 1$ . Moreover,

$$\left| (\|x_1\|^{p-1}x_1^*, \|x_2\|^{p-1}x_2^*)(T(x_1, x_2)) \right| = \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, f_2)(\omega)d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, g_2(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, g_2(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, g_2(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(f_1, g_2(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(g_1(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(g_1(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(g_1(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(g_1(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(g_1(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(g_1(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(g_1(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(g_1(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(g_1(\omega))d\mu(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(g_1(\omega), g_2(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega))S(g_1(\omega), g_2(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega), g_2(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega), g_2(\omega) \right| \le v(S) \cdot \frac{1}{2} \left| \int_{\Omega} (g_1(\omega), g_2(\omega), g_2(\omega), g_2(\omega) \right| \le$$

This yields  $v(T) \leq v(S)$ . Consequently  $\{v(T) : T \in S_{l_p^2(X)}\} \subset \{v(S) : S \in S_{L_p(\mu,X) \oplus_p L_p(\mu,X)}\}$  which yields  $n(L_p(\mu,X) \oplus_p L_p(\mu,X)) \leq n(l_p^2(X))$ . So

$$n(L_p(\mu, X)) \le n(l_p^2(X))$$

Now, for any integer  $m \geq 1$ , with the same work as above, we obtain

$$n(L_p(\mu, X)) \le n(l_p^m(X))$$
.

It follows from Theorem 2.1 that

$$n(L_p(\mu, X)) \le n(l_p(X))$$
.

If  $\mu$  is atomic then  $L_p(\mu, X)$  is isometric to  $L_p(\nu, X) \oplus_p \left[ \bigoplus_{i \in I} X \right]_{l_p}$  for a suitable set I and an atomless measure  $\nu$ . With the help of Remark 2 [9], we also have  $n(L_p(\mu, X)) \leq n(l_p(X))$ . The reverse inequality  $n(L_p(\mu, X)) \geq n(l_p(X))$  follows with the same technique used in [5] for the scalar case.

**Corollary 2.3.** Let  $(\Omega, \Sigma, \mu)$  be a  $\sigma$ -finite measure space. Then, for every Banach space X and every real number  $p, 1 \leq p < \infty$ 

$$n(L_p(\mu, X)) = \lim_{m} n(l_p^m(X)) \cdot$$

# 3 On the positivity of the numerical index of $l_p$ -space

It was proved that the numerical index of  $l_p^m$ ,  $p \neq 2$ , m = 1, 2, ... cannot be equal to 0 this is equivalent to that the numerical radius and the operator norm are equivalent on  $B(l_p^m)$ ,  $p \neq 2$  (see Theorem 2.3 [6]). In this section we shall also prove that both norms are equivalent on  $B(l_p, l_p^m)$ .

**Theorem 3.1.** For every real number  $p \geq 1, p \neq 2$  and every integer m, the numerical radius is equivalent to the operator norm on  $B(l_p, l_p^m)$ . Here  $l_p$  is real and  $l_p^m$  is identified with its natural embedding in  $l_p$ .

*Proof.* Let  $T = (t_{ik}) \in B(l_p, l_p^m)$ . We first have

$$||T|| \leq \left\| \left( \sum_{k=1}^{\infty} |t_{1k}|^{q} \right)^{\frac{1}{q}}, ..., \left( \sum_{k=1}^{\infty} |t_{mk}|^{q} \right)^{\frac{1}{q}} \right\|_{p}$$

$$\leq \left( \sum_{k=1}^{\infty} |t_{1k}|^{q} \right)^{\frac{1}{q}} + \cdots + \left( \sum_{k=1}^{\infty} |t_{mk}|^{q} \right)^{\frac{1}{q}}.$$

Consider  $\{T^j\} \in B(l_p, l_p^m)$  defined by  $T^j e_k = T e_k$  for  $k \neq j$  and  $T^j(e_j) = 0$ . Then for  $x = \sum_{k=1}^{\infty} x_k e_k \in S_{l_p}$  we have

$$x_x^*(T^1x) = \varepsilon_1 |x_1|^{p-1} \sum_{k=2}^{\infty} t_{2k} x_k + \dots + \varepsilon_m |x_m|^{p-1} \sum_{k=2}^{\infty} t_{mk} x_k \qquad (\varepsilon_j \in \{-1, 1\}).$$

Take  $x_1 = \varepsilon_1 2^{-1/p}$  with  $\varepsilon_1 \in \{-1, 1\}$  we obtain

$$\left| x_x^*(T^1 x) \right| = \left| 2^{-1/q} \left( \sum_{k=2}^{\infty} t_{1k} x_k \right) + \varepsilon_1 \left\{ \varepsilon_2 |x_2|^{p-1} \sum_{k=2}^{\infty} t_{2k} x_k + \dots + \varepsilon_m |x_m|^{p-1} \sum_{k=2}^{\infty} t_{mk} x_k \right\} \right| \le v(T^1)$$

Since  $\varepsilon_1$  is arbitrary in  $\{-1,1\}$  then

$$2^{-1/q} \Big| \sum_{k=2}^{\infty} t_{1k} x_k \Big| + \Big| \varepsilon_2 |x_2|^{p-1} \sum_{k=2}^{\infty} t_{2k} x_k + \dots + \varepsilon_m |x_m|^{p-1} \sum_{k=2}^{\infty} t_{mk} x_k \Big| \le v(T^1).$$

And in particular

$$2^{-1/q} \Big| \sum_{k=2}^{\infty} t_{1k} x_k \Big| \le v(T^1)$$

for all  $(x_2, ..., x_m, ...) \in l_p$  such that  $\sum_{k=2}^{\infty} |x_k|^p = \frac{1}{2}$ . That is

$$\frac{1}{2} \Big| \sum_{k=2}^{\infty} t_{1k} y_k \Big| \le v(T^1) \quad \forall (y_2, ..., y_m, ...) \in S_{l_p}$$

which yields

$$\frac{1}{2} \left( \sum_{k \neq 1} |t_{1k}|^q \right)^{\frac{1}{q}} \le v(T^1).$$

The same work as above shows that

$$\frac{1}{2} \left( \sum_{k \neq j} |t_{jk}|^q \right)^{\frac{1}{q}} \le v(T^j) \tag{*}$$

for j = 1, 2, ..., m. Now let  $R^j = T - T^j$  then we have

$$v(T^j) \le v(T) + ||R^j||.$$

And following (\*) we obtain

$$\left(\sum_{k=1}^{\infty} |t_{jk}|^{q}\right)^{\frac{1}{q}} \le 2\left(v(T) + ||R^{j}||\right) + |t_{jj}|$$

which yields

$$||T|| \le 2mv(T) + 2\sum_{j=1}^{m} ||R^{j}|| + \sum_{j=1}^{m} |t_{jj}|.$$

Now let  $\{T_n\}$  be a v-cauchy sequence in  $B(l_p, l_p^m)$ . Since  $v(T_n P_m) = v(P_m T_n P_m) \leq v(T_n)$  where  $P_m$  is the operator projection on  $l_p^m$  (see [5] p 4), and using the fact that in finite dimensional space  $l_p^m$  both norms are equivalent, then each  $R_n^j = T_n - T_n^j$  converges in operator norm to some  $R^j$ . Therefore  $\{T_n\}$  is  $\|\cdot\|$ -cauchy. This completes the proof of the Theorem 3.1.

It's still unknown if the numerical radius and the operator norm are equivalent on the Banach space  $B(l_p)$ ,  $p \neq 2$  which gives a complete answer to the question of C. Finet and D. Li.
